Striped Roman	24-36"	80-90	I	medium	Brilliant color, meaty and flavorful.
Woodle Orange	24-30"	75	I	medium	Excellent flavor, bright orange color.

Soil Preparation

Prepare vegetable beds by spading deeply. Have your soil tested to determine appropriate amendments. For existing beds add about 2 inches of compost and turn the soil over again. Then rake it smooth and the bed will be ready for plants.

* Best Soil Contains:

10/20% Clay + 25-60% Silt + 20/50% Sand = Loam

* 1/3 of the final mix should be organic matter
(peat moss, manure, bark, compost).

* Mulch:

A 2-3" layer around will help prevent some weeds, also will retain moisture in the soil longer and maintain a more stable soil temperature. Straw or weed-free hay is a good choice for vegetable garden mulch.

* Soil pH affects plant metabolism.

Optimum pH for vegetables is between 6.0 and 7.5.

Pounds of Limestone needed Per 100 sq. feet to raise pH to 6.5:

Current pH	Sandy Loam	Loam	Clay Loam
5.5	6	8	10.5
6.0	3	4	5.5

Terenzo	20"	56	D	x-small	-	Container
Tumbler	24-30"	50	D	x-small	-	Sweet Cherry
Yellow Pear	30-36"	78	I	x-small	-	Yellow

I = Indeterminate, grow and bear indefinitely until killed by frost.
D = Determinate, small compact plants with stems 12-18" long.
 Fruit forms on the ends of the branches. The plants stop bearing

V=Verticillium root rot, **F**=Fusarium wilt, **N**=Nematodes,
A=Alternaria (early blight), **T**=Tobacco Mosaic Virus,
S=Stemphylium.
